ASSESSING MARKET ACTION WITH INDICATORS AND HISTORY

September 4, 2008

Issue 138

Market Overview

Summary of Recent Active Studies (see <http://QuantifiableEdges.blogspot.com> or Letters from listed dates for details)

Study Date	Description	Time span	Bias	Avg Max Move	Avg MM + 1 Std Dev
August 31, 2008	Gap Dn then Drop No 3day Lo	1-3 days	Bullish	2.50%	4.30%
August 31, 2008	Gap Up Gap Down	1-6 days	Bearish	-2.60%	-4.80%
August 29, 2008	2 Days 75% Brdth-No 10 hi	1-10 days	Bearish	-3.27%	-5.69%
August 27, 2008	Weak Bounce	1-17 days	Bearish	-5.30%	-8.90%
August 26, 2008	Bad Breadth & Volume	1-15 days	Bullish	3.54%	6.37%
August 25, 2008	3 Up While Volume Declines	1-13 days	Bearish	-2.76%	-5.24%
8/19 & 8/31	1% Drop Extreme Low Vol	1-10 days	Bearish	-4.04%	-7.14%
August 15, 2008	SPX up 0.5 Vol Lowest in 20	1-20 days	Bearish		
August 8, 2008	Nasdaq Dn Sox Up	1-30 Days	Bullish		
July 7, 2008	5 Weeks Lower	1-10 weeks	Bearish		
March 17, 2008	Consumer Sentiment Stretch	1-12 months	Bullish		

If the avg max move is achieved it will appear in **bold and green**. If the avg + 1 std deviation is achieved, the study will be removed from active status.

Short-term Outlook (1-5 days) –slightly bullish – updated 9/3

Market performance was somewhat mixed on Wednesday. The Dow was up slightly, the S&P 500 was down slightly and the Nasdaq lost a chunky 0.6%. Semiconductors led the downside, losing over 4%. Volume was relatively high and advancers outpaced decliners by a slim margin.

The positive breadth in a down market is often perceived as bullish. [In tonight's blog I show](#) that in reality it tends to be neutral at best.

I've discussed a few times recently the Semiconductors propensity to lead the rest of the market. While the big guys were mixed with small changes the SOX dropped over 4%. I ran a study tonight to gauge the possible significance of this:

Dow Jones 30 closes up while SOX loses at least 4%. Buy Dow on close. Sell X days later. \$100k/trade. 1995-present.

X Days	Net Profit	Trades	Wins	Losses	% Wins	Avg Win	Avg Loss	W/L Ratio	Profit Factor	Avg Trade
20	(\$5,232.30)	14	7	7	50.00	\$1,935.21	(\$2,682.69)	0.72	0.72	(\$373.74)

1	(\$5,438.56)	18	6	12	33.33	\$1,275.54	(\$1,090.98)	1.17	0.58	(\$302.14)

Mixed results over the intermediate-term. The first three days seem to have some bearish tendencies, though.

There are a large number of studies currently active. Below is tonight's Aggregator chart:

The drop in the S&P the last few days has put it in a position where price action has badly underperformed expectations. The green Aggregator line is basically dead even. This indicates no consensus among the studies. Too many of them have been offsetting each other for the Aggregator to suggest conviction. The past two nights we have seen some high probability studies suggesting a bounce is likely. Although it's not clear when looking at the Aggregator, I feel the likelihood of a bounce in this choppy environment after 3 down days is quite high. I will therefore be looking to add to the current index position.

Intermediate-term Outlook (1 week – 2 months)–neutral to slightly bearish–updated 9/2

I've been looking for a sign that the market is ready to launch a new bull move higher and I've yet to find it. In fact, over the last couple of weeks I've begun to see some negatives line up.

Last week I showed a detailed study of the VIX:VXV ratio. The bottom line was that a move below 0.90 in the ratio tended to have bearish implications over the intermediate-term timeframe. With the slow end-of-August trading being factored in it was suggested that the VIX may be a bit lower than normal. August is now behind us. Even with the sharp drop on Friday the ratio still lies only at 0.91. A move below 0.9 from here on out would act as confirmation of last week's signal. It would suggest a difficult environment could ensue over the next couple of months.

Another indicator that is continuing to suggest bearish consequences is the Nasdaq to NYSE volume ratio. I discussed this ratio two weeks ago as we saw a bit of a spike up at the time. Historically, when the Nasdaq volume begins to run high as compared to NYSE volume, it suggests excessive speculation. Often this leads to a selloff. On Wednesday we once again saw the ratio spike to a high level. Below is another study with bearish intermediate-term results.

<i>The Nasdaq to NYSE volume ratio spikes to its highest level in 50 days. Buy Nasdaq on close. Sell X days later. \$100k/trade. 1990-present.</i>															
X Days	Net Profit	Gross Profit	Gross Loss	Trades	Wins	Losses	% Wins	Max Win	Max Loss	Avg Win	Avg Loss	W/L Ratio	Profit Factor	Avg Trade

5	(\$47,022.63)	\$19,545.49	(\$66,568.12)	21	7	14	33.33	\$4,835.70	(\$12,889.14)	\$2,792.21	(\$4,754.87)	0.59	0.29	(\$2,239.17)	

There is deterioration in the number of trades because of the amount of overlap when looking at longer periods. These results are shockingly bad when you consider the fact that the Nasdaq made strong gains over the test period. Looking out 100 days, 7 of 9 trades were losers. The average loss was 18%. There were two wins, one that gained 28% and the other that only scratched out a 3% rise. A few weeks ago I dismissed the spike in this ratio, because I found the concept of excessive speculation to be

questionable due to the high levels of bearishness in both consumer and market sentiment indicators. I no longer feel it should be dismissed, but rather considered carefully.

A few weeks ago the price action in the Nasdaq, and especially in the SOX, had provided some bullish implications going forward. Upside leadership in these areas tends to act as a positive for the entire market. Over the last two weeks this has changed. The Nasdaq and SOX indices have pulled back much sharper than the broader market. In fact, while the S&P 500 is in the middle of its three-week range, the Nasdaq is at the lower end of its range and the SOX rolled over on Friday to post a 3-week low.

I did run some studies to see if there were ominous implications when the Nasdaq was in a position of leadership and then pulled back sharply in comparison to the NYSE. Results weren't terribly compelling but they did have a bullish tilt. They suggested you're normally better off just buying sharp pullbacks and not worrying about deteriorating leadership. With the studies we've seen over the last few weeks suggesting strong SOX leadership is a positive, studies showing bullish implications with regards to failing leadership would have to be much more convincing before I'd believe the SOX breakdown could possibly be a good thing.

In summary, the current studies are mixed with a slightly bearish tilt. Volume patterns remain weak. Breadth has picked up, but not to the levels that would imply a bullish outlook based on Lowry's research of 90% upside days. (These were discussed about a month ago – email me if you need that report.) Rather we've been treated to upside days of between 75% and 80% which haven't provided bullish expectations. The combination of the VIX:VXV ratio and the Nasdaq:NYSE Volume ratio suggests investors may be getting a bit careless. Individually, these kinds of readings carry negative expectations. The volume and volatility based studies may be questioned due to the slow summer trading but that should end this week as traders get back to work. The next week or two could be critical as the market may tip its hand
